## INTASTOP PREVENTS DAMAGE TO HUNDREDS OF DOORS AT ROCHDALE INFIRMARY

Hospitals throughout the country are finding that prevention is better than a cure.

**Intastop** have supplied their door edge guards for refurbishment programmes on both new and existing fire doors in a number of Britain's leading hospitals, including Rochdale Infirmary as illustrated in the photograph.

As with any hospital of this size, traffic in and around the numerous hospital corridors is extremely busy, with movements of staff, patients and equipment.

It is important that fire integrity is protected on all the doors within a hospital. The brush and intumescent seals that **Intastop's** door edge guards feature are tested for ½ hour and 1 hour use, which means door edges are protected from damage without the worry of losing fire integrity.

**Intastop** door edge guards are manufactured in widths of 42mm, 44mm, 46mm and 55mm to fit all standard door types, and are available in a standard Satin Anodised Aluminium finish. Other anodised finishes and colour coatings are available to blend in with existing décor.
